PORTER LEE CORPORATION

Customer User Manual

Create tickets, follow updates, exchange messages and manage attachments.

Web edition 1.0.1.56
Updated October 30, 2026

Use this guide while working in the Support Portal. The numbered steps describe the available workflow; buttons depend on your account permissions. Screens show DEV examples, not live customer instructions.

Testing only: support.porterlee.com/dev/

In this guide

02 Sign in and find your way

03 Find a ticket

04 Create a ticket

05 Work with an existing ticket

06 Upload view and download documents

07 Add an activity

08 Read send and manage messages

09 Your account and help

10 Using a phone and resolving upload errors

Support: (847) 985-2060 | support@porterlee.com

Sign in and find your way

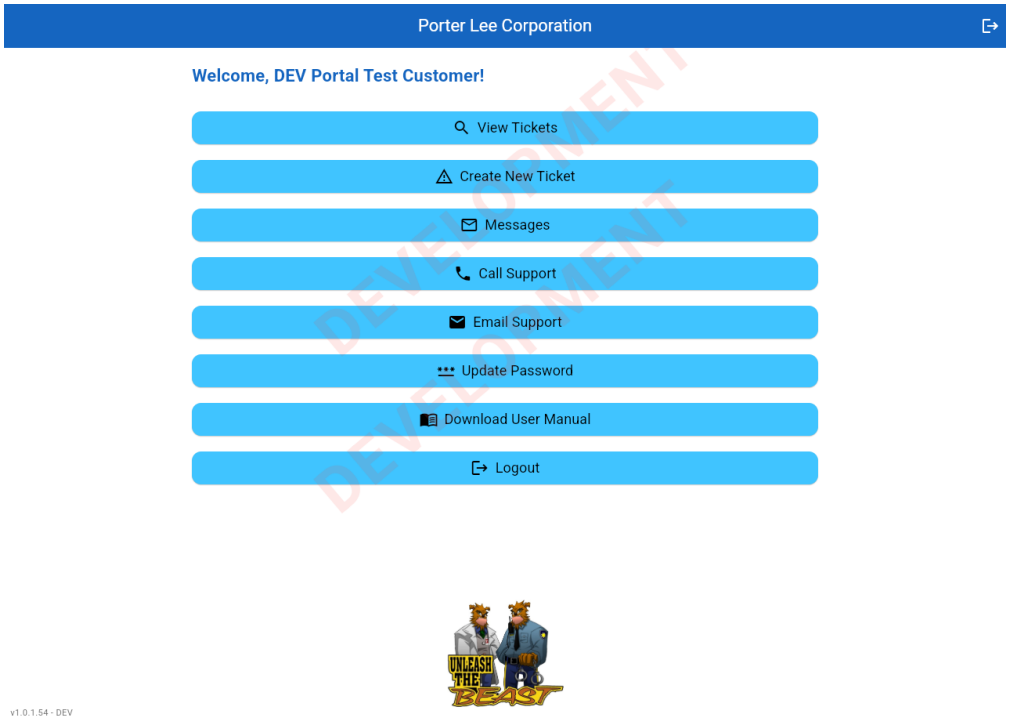

Use the User ID and password supplied by your support contact.

1. Open the portal, enter your User ID and password, then select Login. Do not use a DEV test login on the production site.

2. Choose View Tickets to find existing work, Create New Ticket to report an issue, or Messages to read your received messages.

3. Use the back arrow to return. Use Logout when you finish, especially on a shared computer.

If your account is disabled or locked after failed login attempts, contact support. An administrator can enable it or reset the invalid login count.

DEV screen example. Names, ticket numbers and available controls may differ.

Find a ticket

Ticket search respects your account and customer access permissions.

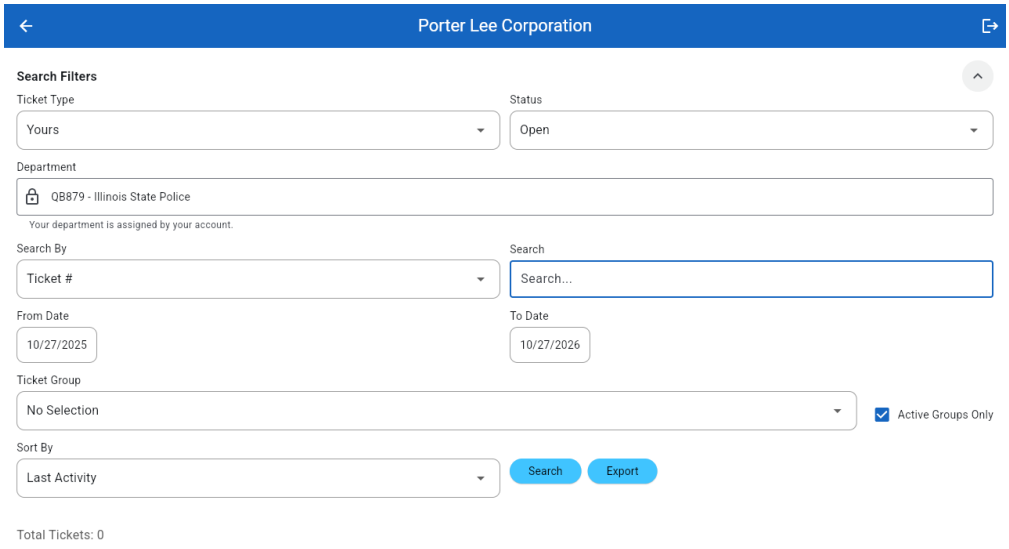

1. Open View Tickets. Choose Yours for tickets you created. Department tickets are available only when your administrator allows them.

2. To find one ticket, select Ticket #, enter its number and click Search. Other search filters are ignored for an exact number, but access restrictions still apply. A single match opens automatically.

3. For a broader search, choose status, dates, description or ticket group, then click Search. Reopen Search Filters to change the search.

4. Choose a sort field and direction. Save as default stores the sort preference in this browser for your account and environment. It does not copy to other devices. Export downloads the matching ticket data as CSV.

If your account is set to wait for Search, the filters open without loading tickets. Choose your filters and click Search.

DEV screen example. Names, ticket numbers and available controls may differ.

Create a ticket

Give support enough detail to reproduce the problem.

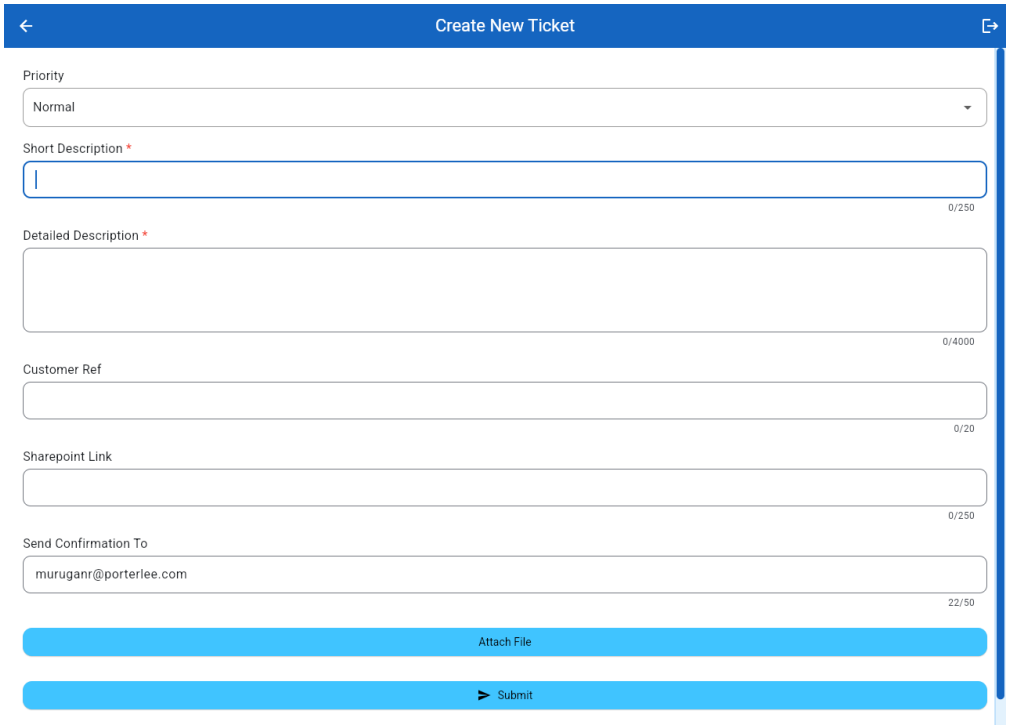

1. Choose Create New Ticket. Enter the priority, short description and detailed description. Include what you expected, what happened and the steps that caused it.

2. Check the confirmation email address before submitting. Add a customer reference or SharePoint link where offered.

3. Attach relevant files. Review the selected filenames. You can remove one pending file or clear the pending list; confirm the removal when asked.

4. Click Submit once and wait for the result. Record the new ticket number. A confirmation email is processed separately by the email service.

If the ticket is saved but an attachment fails, keep the ticket number and use Upload Documents on that ticket. Do not create another ticket just to retry an attachment.

DEV screen example. Names, ticket numbers and available controls may differ.

Work with an existing ticket

Open a ticket to read its status, description and related information.

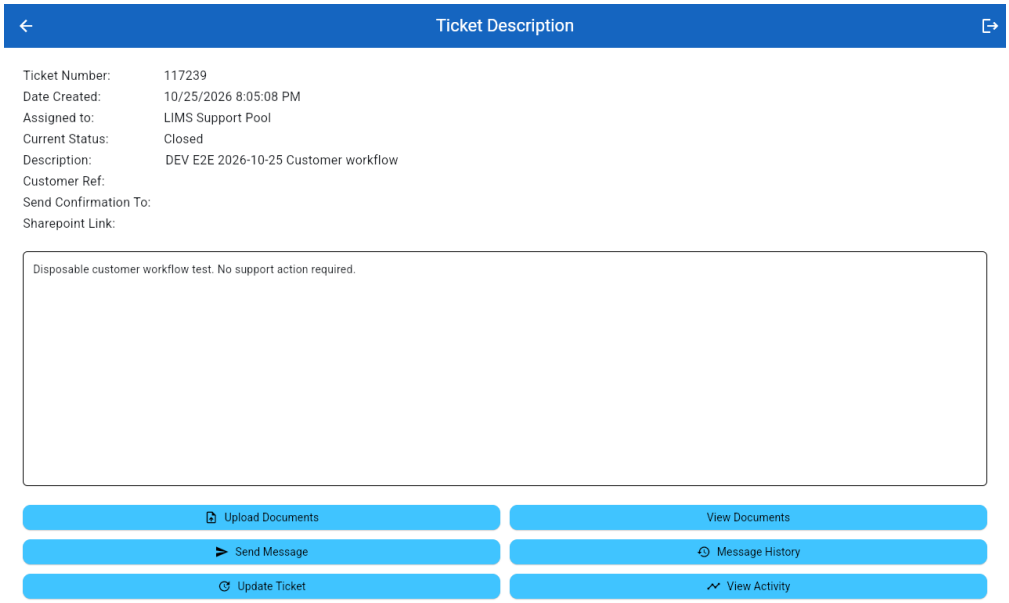

1. Review the ticket number, current status, assigned person and description.

2. Use Update Ticket to change the fields offered to you, such as the customer reference, SharePoint link and confirmation email. Attach files there if needed, then submit.

3. Use Send Message or Message History for ticket-related communication. Use View Activity to read the published updates.

4. Use Upload Documents to add ticket files and View Documents to find existing ticket uploads.

Customer accounts do not have access to design documents or internal activities.

DEV screen example. Names, ticket numbers and available controls may differ.

Upload view and download documents

Ticket files and activity files belong to different parts of a ticket.

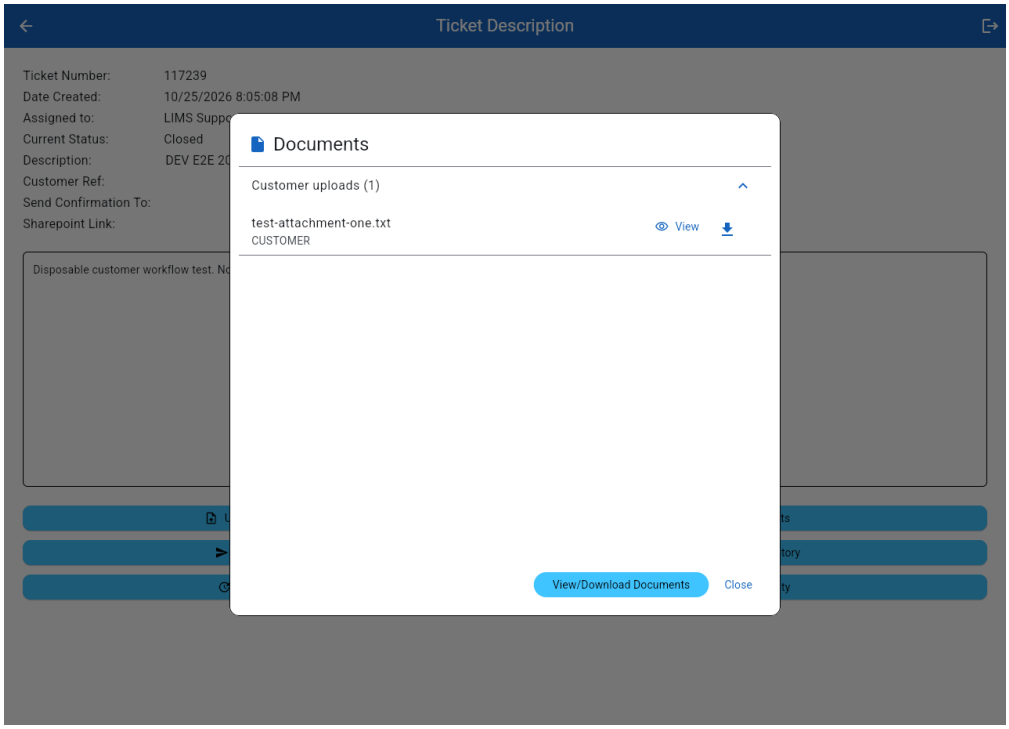

1. For ticket uploads, choose Upload Documents, select the files and wait for the success message. The file should then appear in Documents.

2. Use the visible View control to open a supported preview. Use Download to save the original file. Files without a preview can still be downloaded.

3. For an activity file, open View Activity, then that activity's Documents button. You see only files associated with an activity available to your account.

4. Check the browser's download list or Downloads folder. On a phone, use its download notification or Files app. The portal cannot choose a local folder for you.

Customers cannot delete saved documents. Removing a file from a ticket draft before submission is different from deleting a saved document.

DEV screen example. Names, ticket numbers and available controls may differ.

Add an activity

Use an activity to add information to an existing ticket.

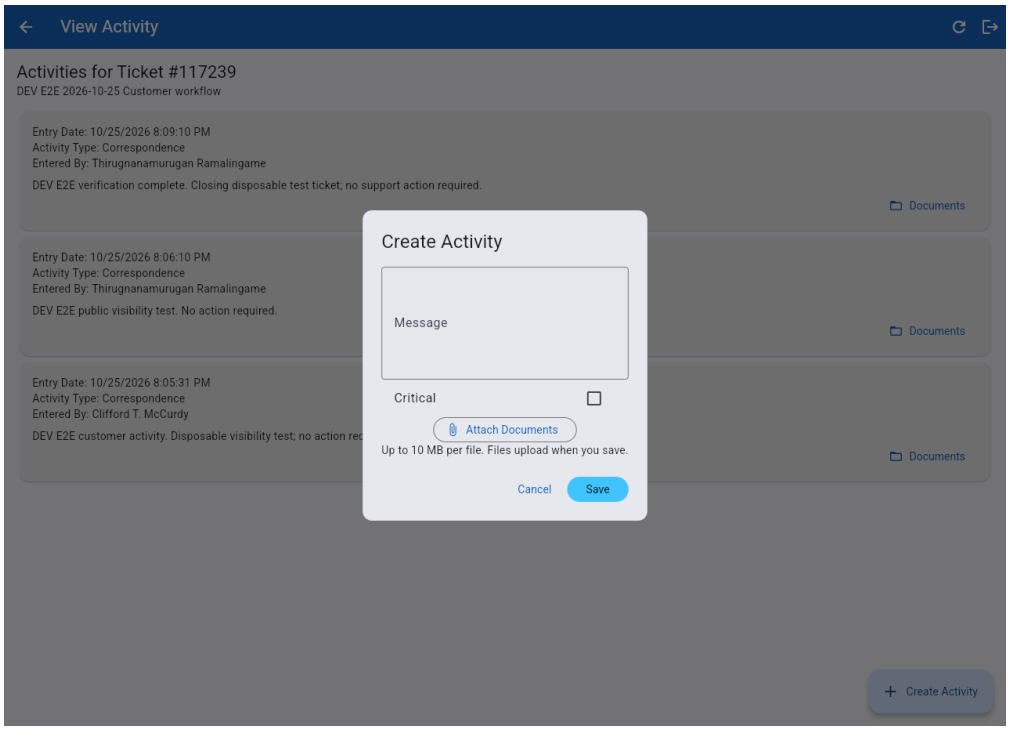

1. Open the ticket and select View Activity, then the option to add an activity.

2. Enter the update clearly. Check any available activity fields before saving.

3. Choose Attach Documents to include files. Pending activity files upload when the activity is saved.

4. If the activity saves but a file fails, retry the remaining upload. The portal keeps the saved activity number so it does not create the activity again.

Activity files are limited to 10 MB per file. Customers see only Web Posting activities. A document preview is not proof that the file has been saved; wait for the upload result.

DEV screen example. Names, ticket numbers and available controls may differ.

Read send and manage messages

Messages is your received-message queue. A message may have a ticket link or may stand on its own.

1. Open Messages. Unread messages are bold. Your customer is fixed to your agency. From lists senders found in your own messages.

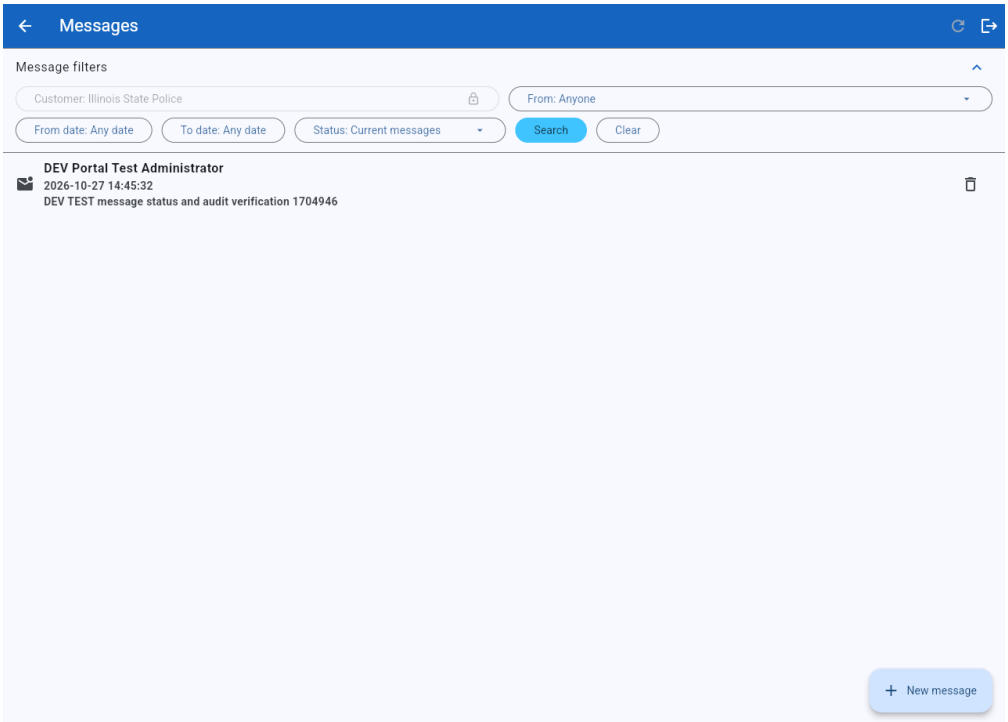

2. Choose a sender or dates and click Search. Changing Current messages, Deleted messages or All messages refreshes the list automatically. Clear restores Current and keeps your agency locked.

3. Open a message to read it. Reply addresses the employee who sent it. Open the linked ticket when needed; returning to Messages refreshes the queue.

4. To start a new message, use New message and select an available group. An assigned QA group appears in addition to the existing LIMS Support group.

5. To remove a message from your queue, choose its trash icon and confirm. Find it later under Deleted or All. Deleted messages are read-only.

Delete only affects your own received copy. It does not erase the database record, retract a sent message or delete another person's copy. Locked messages cannot be deleted.

DEV screen example. Names, ticket numbers and available controls may differ.

Your account and help

The home page provides account, support and download options.

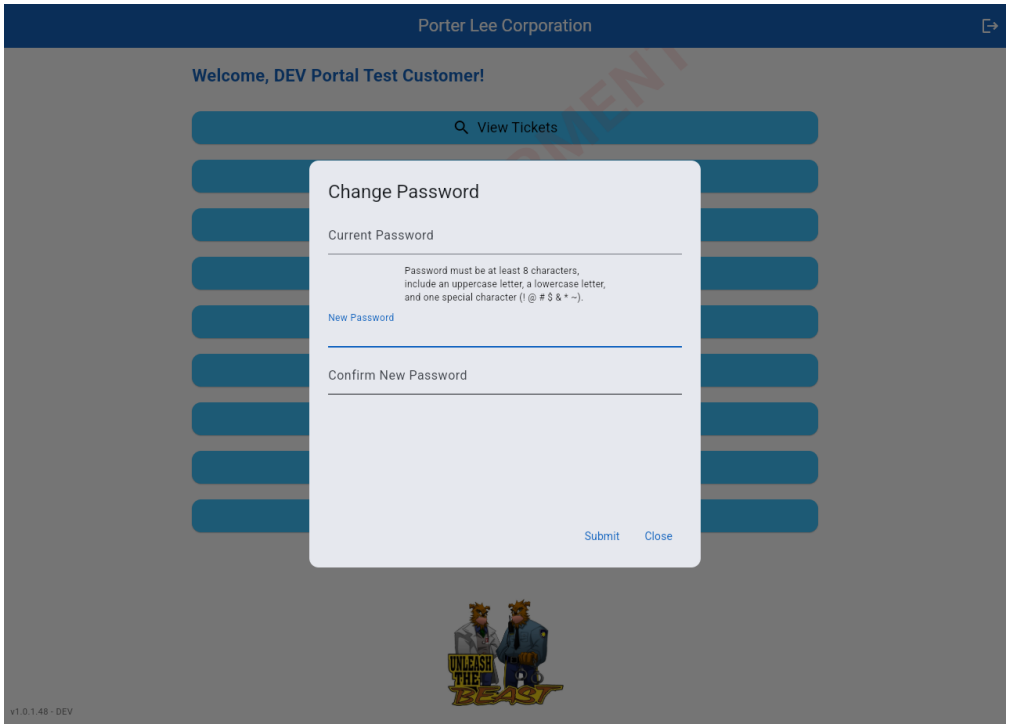

1. Choose Update Password and complete the required password fields. Keep your password private.

2. Call Support offers the number on desktop; supported mobile browsers can offer a call. Email Support opens the available email action.

3. Diagnostic logs are available only to employees. Customer accounts do not have a diagnostic-log download button. Contact Support if you need help investigating a problem.

4. Download User Manual downloads this customer guide as a PDF. Employee accounts receive both guides in one ZIP.

If a button is missing, it may depend on your account permissions. Support can review your account settings.

DEV screen example. Names, ticket numbers and available controls may differ.

Using a phone and resolving upload errors

Use the web portal in your phone's browser. Available camera and file-picker choices depend on the phone and browser.

1. Choose the attachment button and select a photo, video or file. If the phone offers Take Photo or Record Video, allow the camera access needed for that action.

2. For a compatibility check on iPhone, use Camera settings with Most Compatible for new photos and videos. A short, lower-resolution recording is easier to upload. This does not convert existing media.

3. If a selected file is stored only in iCloud, download it to the phone before retrying. Check its size, especially for activity files with the 10 MB limit.

4. If upload fails, read the displayed error. A timeout may leave the outcome uncertain: check Documents before retrying to avoid duplicates. Report the ticket number, filename, file size, phone/browser and exact error to support.

Upload and preview are separate. HEIC, video, PDF or Office files may not preview in every browser. A file that has saved can still be downloaded. Physical iPhone camera and video behavior must be checked on the device.
