PORTER LEE CORPORATION

Employee User Manual

A companion to the customer guide for support staff and portal administrators.

Web edition 1.0.1.54
Updated October 30, 2026

Use this guide while working in the Support Portal. The numbered steps describe the available workflow; buttons depend on your account permissions. Screens show DEV examples, not live customer instructions.

Employee access and daily navigation

Read the Customer User Manual for sign-in, common ticket actions, downloads and phone guidance. This companion covers employee and administrator features.

1. Use your assigned employee-linked portal login. Open View Tickets, Create New Ticket or Messages from Home.

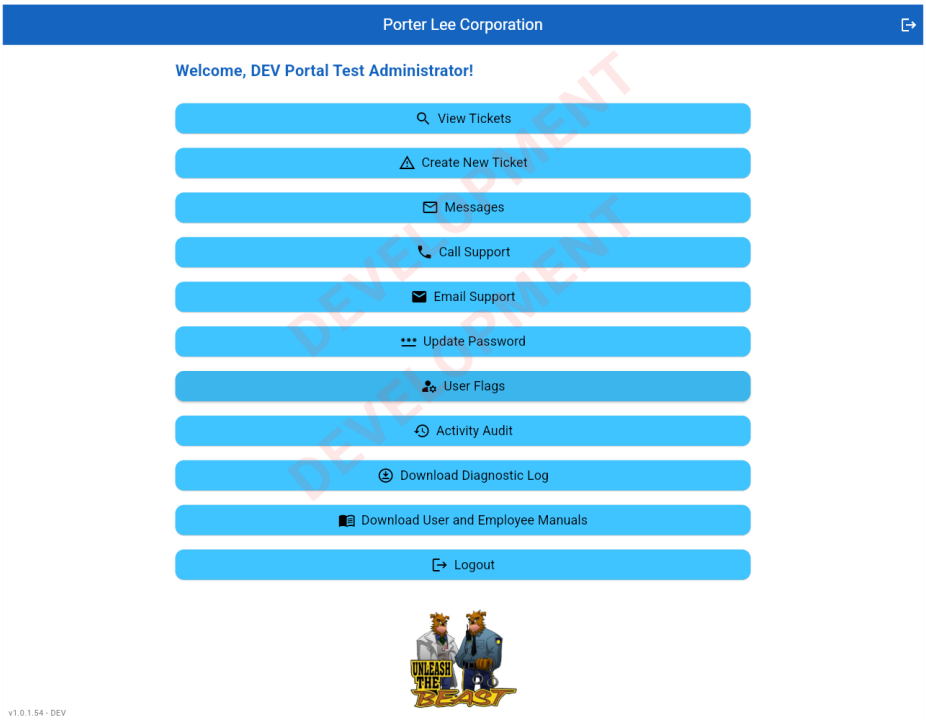

2. Employee accounts can view internal activities and design documents on accessible tickets. Account permissions control document deletion and administration.

3. Use Download User and Employee Manuals on Home. Extract the ZIP to open UserManual.pdf and EmployeeManual.pdf.

4. Administrators also see User Flags to update portal accounts and Activity Audit to review recorded actions. These buttons are not available to regular employees.

5. Use Logout when finished. Contact your supervisor if you need elevated access.

These instructions describe web 1.0.1.54 with the matching service features. If an endpoint is unavailable or the controls differ, report the displayed web version and the action to support.

DEV screen example. Names, ticket numbers and available controls may differ.

Search across customers

Ticket Type and Department are independent employee filters.

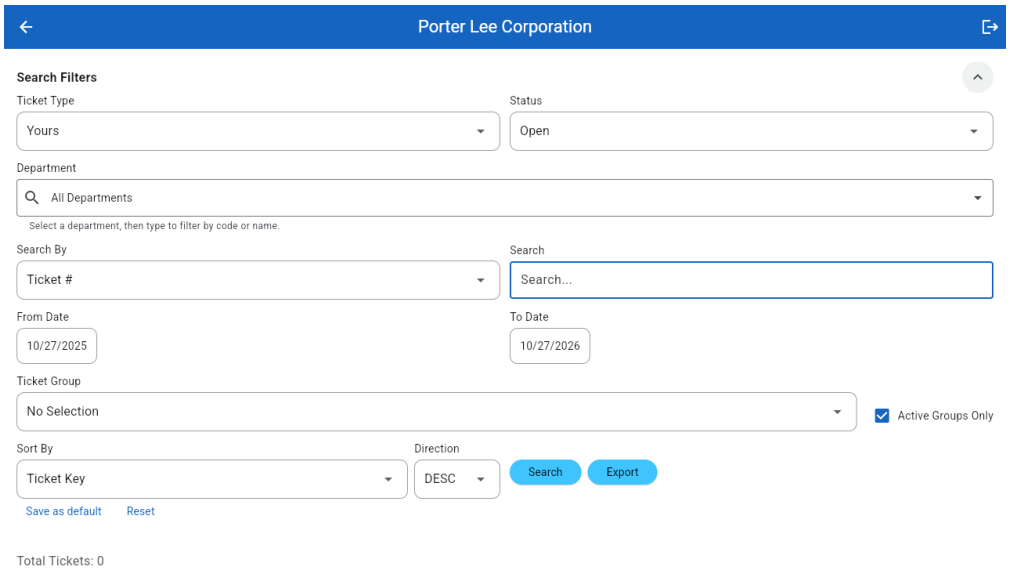

1. Choose Yours + All Departments for tickets assigned to you across customers.

2. Choose Yours + a specific Department for tickets assigned to you for that customer.

3. Choose Department + a specific Department for matching tickets for that customer. Department + All Departments requires a ticket number or description to avoid an unrestricted search.

4. An entered ticket number searches by number only. For other searches, use status, dates, group and sorting. Save as default keeps the sort preference in this browser; Export downloads CSV.

When Wait for Search is enabled, opening the list does not fetch tickets. The filters stay open until you run a search.

DEV screen example. Names, ticket numbers and available controls may differ.

Create and update activities

Employees can see all ticket activities, including entries not marked Web Posting.

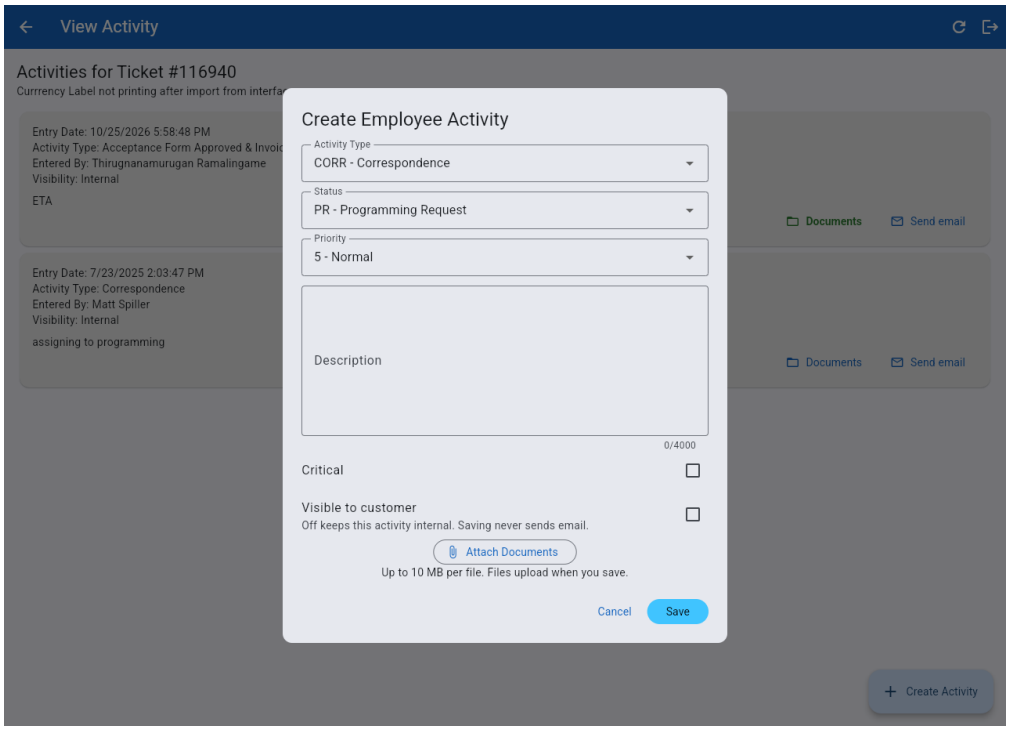

1. Open View Activity and create an activity. Check the activity type and ticket status before saving.

2. Choose Web Posting only when the entry should be visible to the customer. Internal entries stay hidden from customer accounts.

3. Use the permitted Edit or Delete action on activities you created. Editing keeps the same activity number. Confirm deletion when prompted.

4. When closing work, choose the appropriate status and record what was done. Saving an employee activity does not automatically send an email.

Employee-created tickets do not automatically add a message to the portal message queue. Use Send Message when you intend to notify someone there.

DEV screen example. Names, ticket numbers and available controls may differ.

Manage activity and design documents

Use the document area that matches the file's purpose.

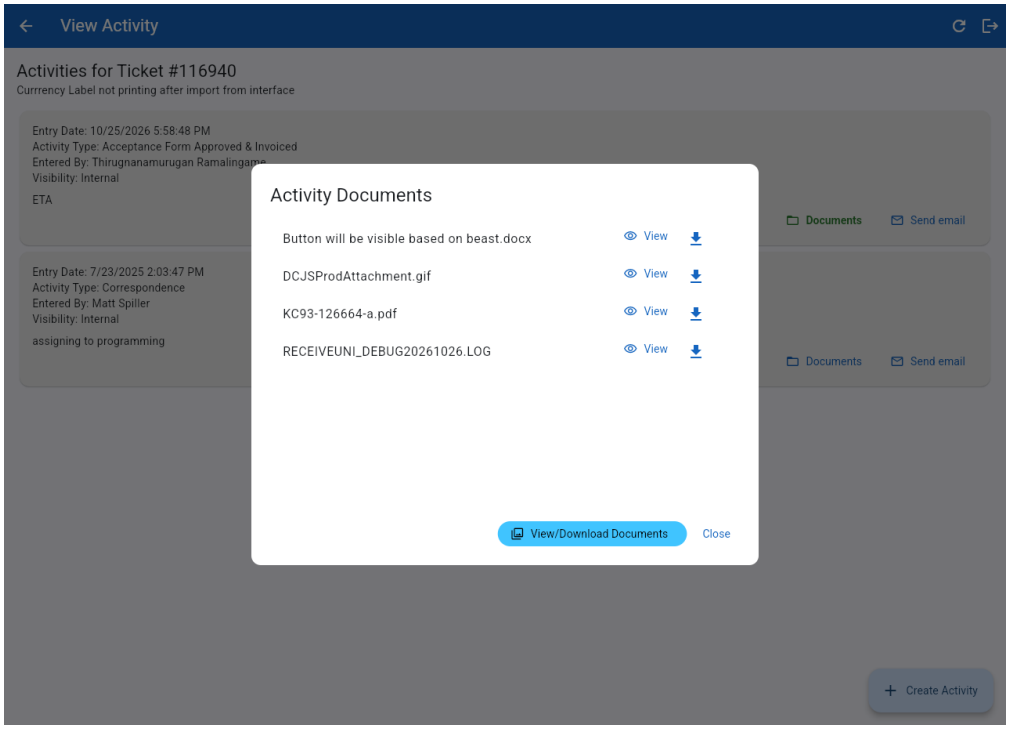

1. Ticket View Documents shows ticket uploads and employee design documents. The top Documents icon also includes activity documents grouped by activity.

2. An activity's Documents button opens that activity's files. Use Attach Documents there, or attach files while creating the activity. Files save against that activity number.

3. Use View for a preview or Download for the original file. The upload spinner indicates work in progress; wait for a success or error message.

4. Trash icons appear only when Allow deleting documents is enabled for your employee account. Confirm before deleting any customer, design or activity file on an accessible ticket.

Document deletion permission is separate from activity editing permission. Customers cannot delete saved documents. Activity uploads are limited to 10 MB per file.

DEV screen example. Names, ticket numbers and available controls may differ.

Send an email from an activity

The manual email action places an email in the publisher queue.

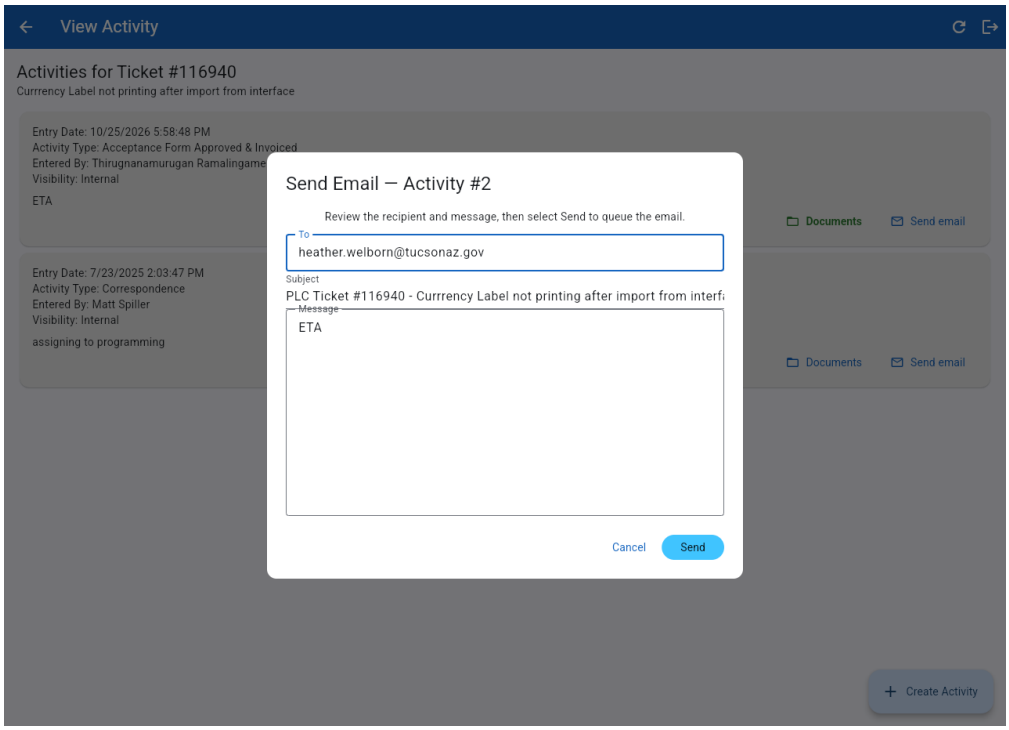

1. Open the saved activity and choose Send email.

2. Review the recipient, subject and body. The recipient defaults to the ticket creator's customer email where available; correct a missing or unsuitable address before sending.

3. Check that the subject identifies the customer/ticket and short description. Edit the message as needed.

4. Click Send once and wait for the queued confirmation. The publisher sends queued mail separately.

Queued does not mean delivered. If the recipient reports no email, give support the ticket/activity and send time. Saving an activity alone never sends the manual email.

DEV screen example. Names, ticket numbers and available controls may differ.

Messages and recipient choices

Your queue contains messages received by you, including messages without a ticket.

1. Filter by customer, From and dates. From is a distinct list of senders from your messages, narrowed by the selected customer. Click Search after changing customer, sender or dates.

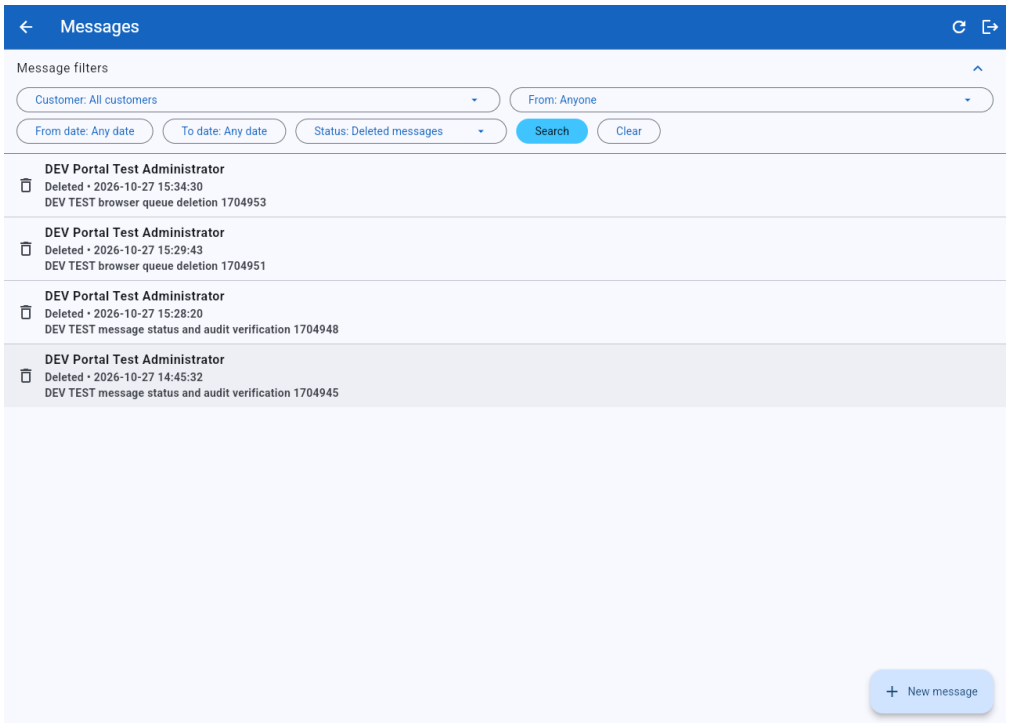

2. Changing Current, Deleted or All refreshes the queue automatically. Unread messages are bold. Returning from a message or linked ticket refreshes the queue.

3. Use New message for a group, employee or customer contact. For a customer, choose the customer first, then search its contacts. Existing customer/contact filters can preselect the recipient.

4. If a ticket is linked, review its number and short description before sending. Ticket Send Message and Message History retain their ticket context.

5. Delete only your own received messages. Confirm the action. The database row and other recipients' copies remain; Deleted and All provide reference access.

Administrator access does not allow deleting another person's message queue. Deleted and locked messages do not offer a Delete action.

DEV screen example. Names, ticket numbers and available controls may differ.

Manage portal accounts

The User Flags button is available to authorized portal administrators only. It is used to update user accounts and portal permissions.

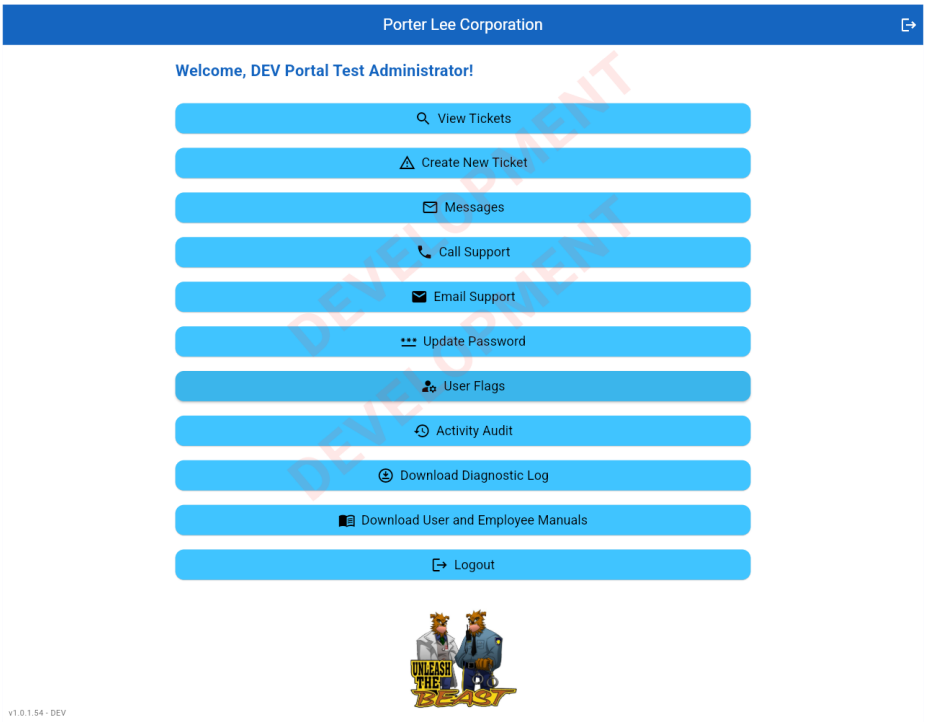

1. Open User Flags. Select the customer, then search and select a contact linked to that customer.

2. Enable portal account controls whether the selected user can sign in. It does not grant administrator permissions. Only authorized administrators should change account permissions.

3. Use Set / Reset Password or Reset Invalid Login Count as needed. Password changes use the service's password-hash workflow.

4. Choose the other permissions described on the next page, click Save, and have the user sign out and sign in again to reload account settings.

Select the intended contact carefully before saving. If User Flags is not available to you, contact your supervisor to request elevated access. Do not change database settings to obtain access.

DEV screen example. Names, ticket numbers and available controls may differ.

Understand account permissions

The switches control separate features. Enabling one does not enable the others.

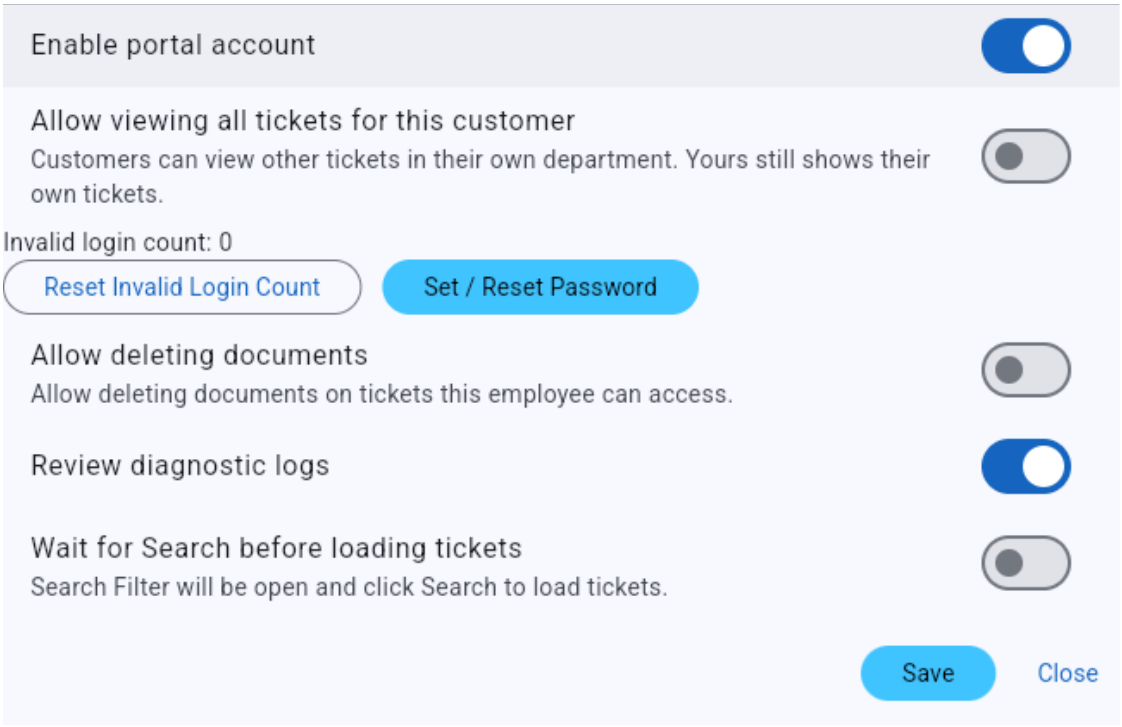

1. Allow viewing all tickets for this customer permits customer users to view other contacts' tickets within their own department. Yours still means their own tickets. It never opens other agencies.

2. Allow deleting documents applies only to employees. It permits deletion of saved ticket uploads, activity files and design documents on accessible tickets.

3. Review diagnostic logs is available only for employee accounts. An administrator selects the employee in User Flags, turns this option on and saves. When enabled, the employee sees the home download button. Customer accounts cannot download diagnostic logs, even if their flag is enabled.

4. Wait for Search before loading tickets opens the ticket filters without loading records. The user clicks Search when ready.

These permissions are managed by authorized administrators. Contact your supervisor if a required feature is unavailable. Request only the access needed for your work.

User Flags - account permissions (detail). Administrator-only controls.

Review Activity Audit

The Activity Audit button is available to authorized portal administrators only. It shows recorded portal actions and is separate from downloadable diagnostic logs.

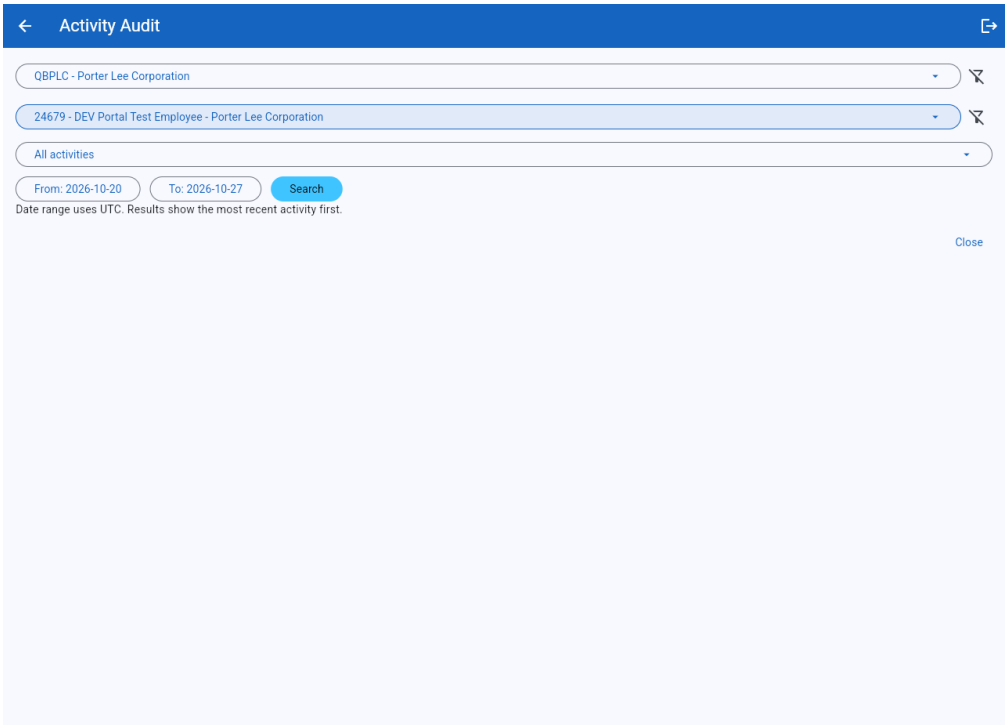

1. Open Activity Audit. Select a customer, then a contact, or use the adjacent all-customer/all-contact control to broaden the search.

2. Choose an activity type, such as message deletion, document upload or an account update. Set the date range and click Search.

3. Review the user, action, time, result and available details. Audit dates use UTC; account for the time-zone difference when checking a local event.

4. For a message deletion, check the message key and the deleted-flag change. A successful portal message deletion is recorded with its audit entry.

If Activity Audit is not available to you, contact your supervisor to request elevated access. Diagnostic ZIP files may contain multiple customers and must remain with authorized support employees.

DEV screen example. Names, ticket numbers and available controls may differ.

Open group setup in Prospect

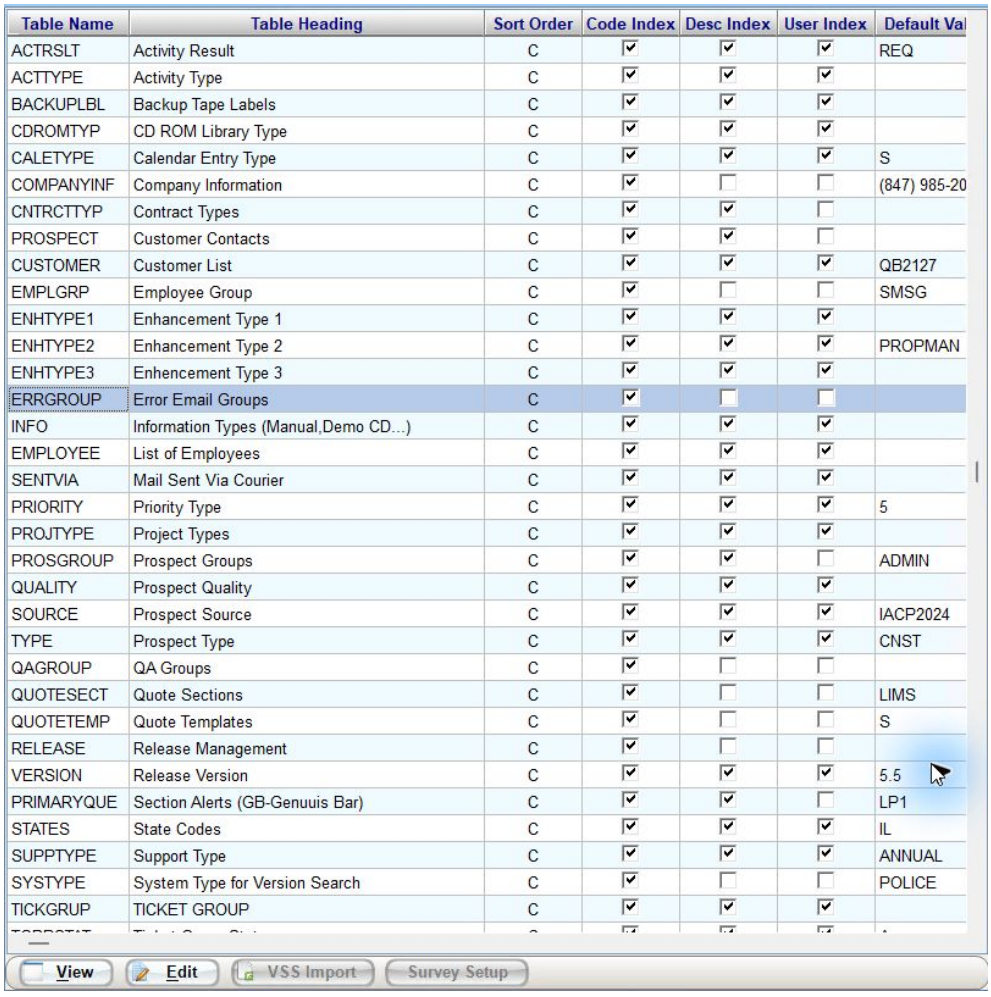

Group setup is maintained in desktop Prospect by authorized staff. It is not part of the portal User Flags popup.

1. Open System in Prospect. Find QA Groups or Error Email Groups in the code-table list.

2. Select the table and click Edit to open its group maintenance screen.

3. Use QA Groups for customer message recipients. Use Error Email Groups for customer-related publisher error notifications.

Contact your supervisor if you need permission to maintain groups. Check that you are using the intended DEV or production database.

DEV screen example. Names, ticket numbers and available controls may differ.

Create and maintain QA groups

The QA group defines the employees offered as a customer-specific message group.

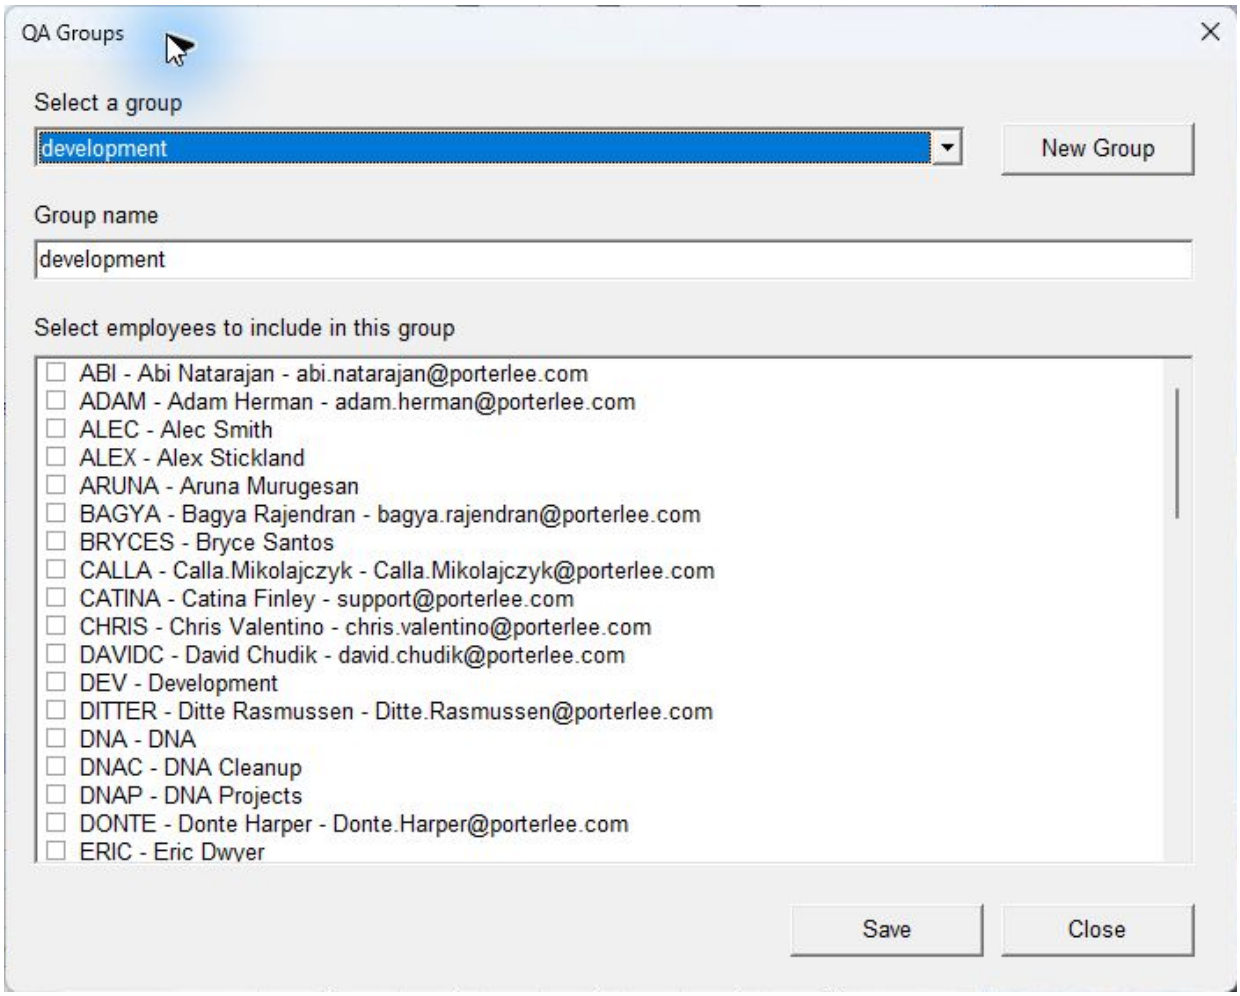

1. To create a group, click New Group and enter a clear group name.

2. To maintain a group, choose it from Select a group. Review its name and current employee membership.

3. Check the active employees who should receive messages for this group. Uncheck employees who should no longer belong to it.

4. Click Save. Reopen the group and confirm the membership. Assign the group to the customer using the customer group screen.

An assigned QA group is added to the customer's message choices. The existing LIMS Support option remains available.

DEV screen example. Names, ticket numbers and available controls may differ.

Create and maintain error email groups

Error email groups receive customer-related publisher error notifications. They are separate from ordinary ticket confirmation emails.

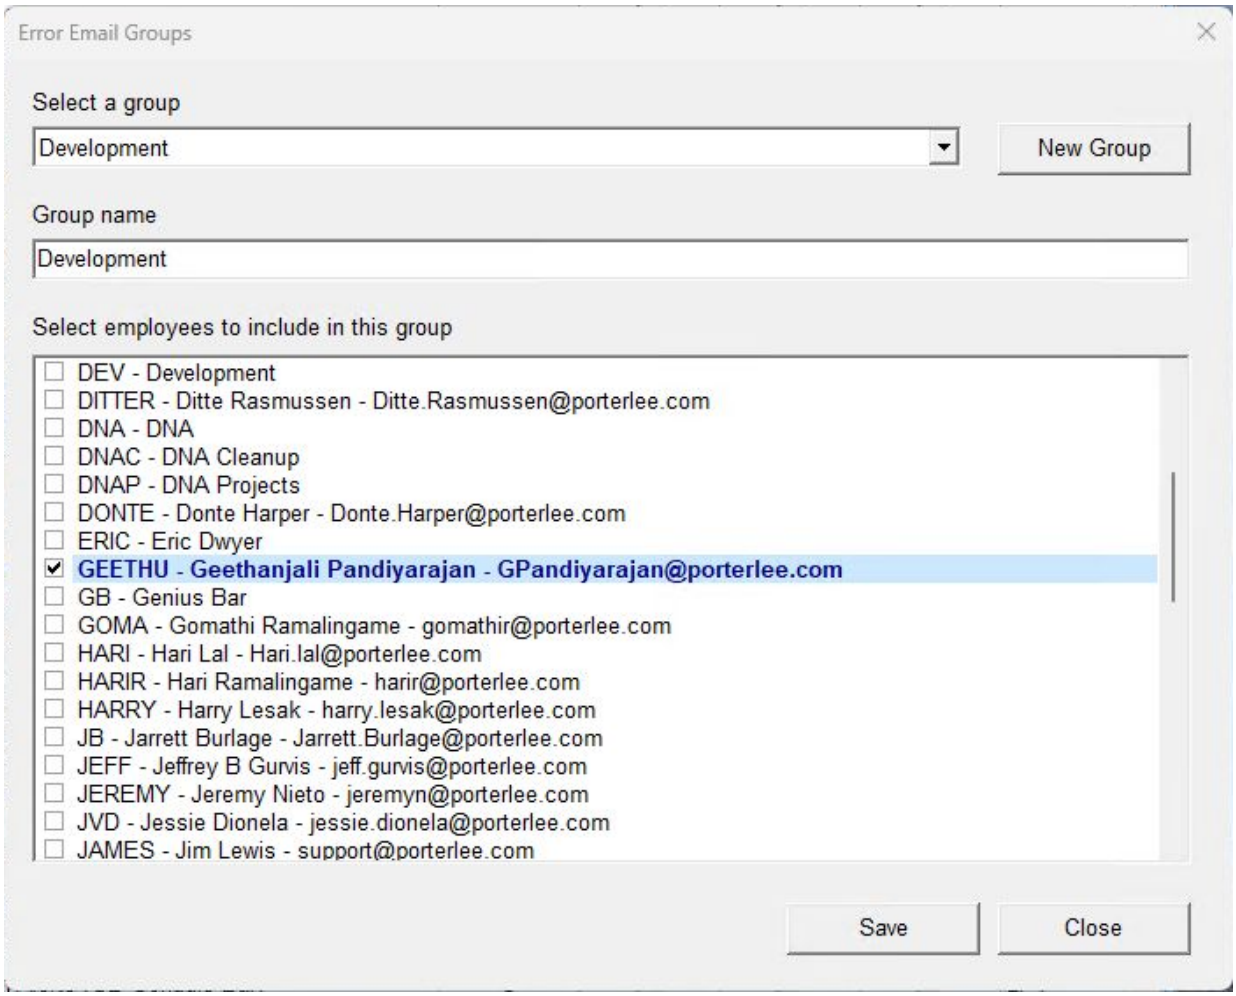

1. Open Error Email Groups. Click New Group to create one, or select an existing group to update it.

2. Enter or review the group name. Check the employees who should receive these error notifications and uncheck those who should be removed.

3. Confirm that the selected employees have the correct email addresses. Click Save and review the saved membership.

4. Assign the group to the customer in the Customer Groups screen.

With no customer error group assigned, the existing Geethu fallback is used. General publisher startup errors can use a separate configured fallback.

DEV screen example. Names, ticket numbers and available controls may differ.

Assign groups to a customer

Open the customer/contact in Prospect and use its Customer QA / Error Groups option.

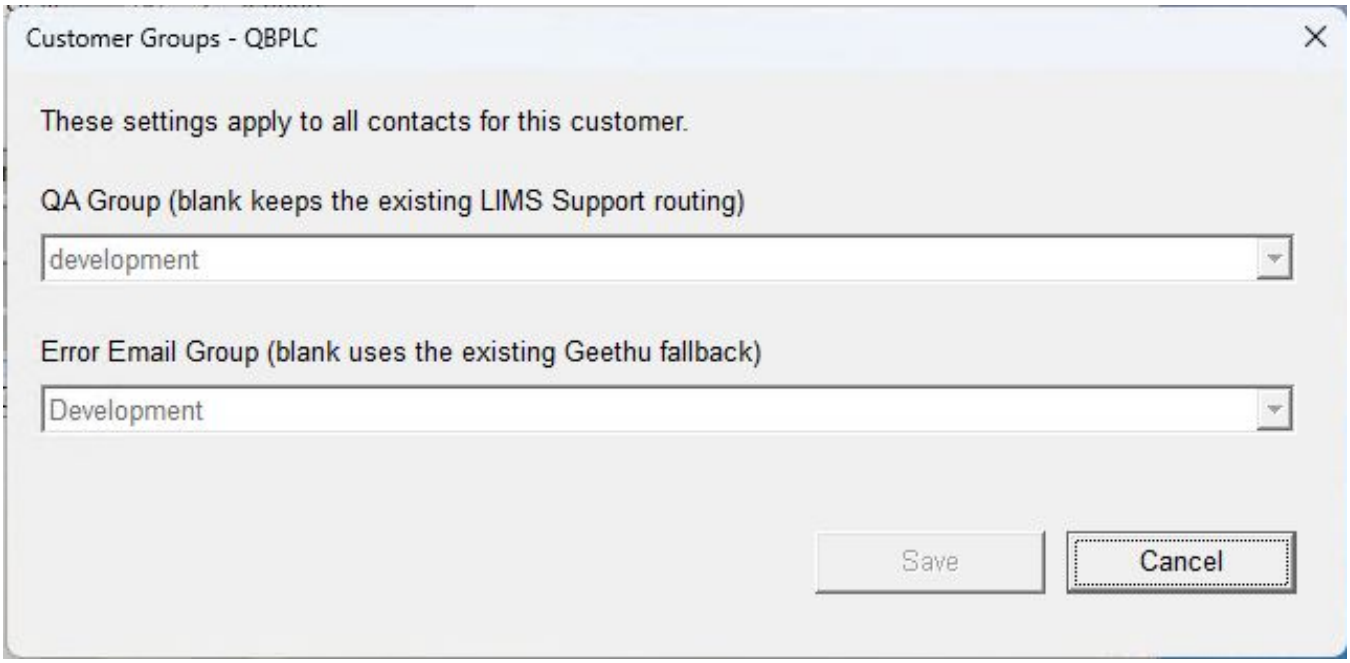

1. Check the customer shown in the window title before making a change.

2. Select a QA Group for portal messaging. Leave it blank to keep the existing LIMS Support routing.

3. Select an Error Email Group for customer-related publisher errors. Leave it blank to use the existing Geethu fallback.

4. Click Save. The assignment applies to all contacts linked to that customer, not just the contact you opened.

After saving, check a portal contact for that customer to confirm the QA group appears. Maintain employee membership in the group screens shown on the preceding pages.

DEV screen example. Names, ticket numbers and available controls may differ.
